

REGIONAL SPECIALISED METEOROLOGICAL CENTRE -TROPICAL CYCLONES, NEW DELHI SPECIAL TROPICAL WEATHER OUTLOOK

DEMS-RSMC TROPICAL CYCLONES NEW DELHI DATED 30.07.2026

SPECIAL TROPICAL WEATHER OUTLOOK FOR THE NORTH INDIAN OCEAN (THE BAY OF BENGAL AND THE ARABIAN SEA) VALID FOR THE NEXT 168 HOURS ISSUED AT 0300 UTC OF 30.07.2026 BASED ON 0000 UTC OF 30.07.2026.

Deep Depression over Western parts of central Chhattisgarh and adjoining east Madhya Pradesh

The Deep Depression over Western parts of central Chhattisgarh and adjoining east Madhya Pradesh remained practically stationary during past 6 hours, and lay centred at 0000 UTC of today, the 30th July 2026, over the same region near latitude 21.9°N and longitude 81.4°E, about 70 km east of Malanjkhanda (42715, Madhya Pradesh), 80 km north of Durg (42876, Chhattisgarh), 80 km west-southwest of Bilaspur (42782, Chhattisgarh), 80 km north-northwest of Raipur (43875, Chhattisgarh), and 130 km east-northeast of Gondia (42871, Maharashtra).

It is very likely to move nearly westwards across Chhattisgarh, east Madhya Pradesh & adjoining Vidarbha and weaken gradually into a depression during next 24 hours.

The estimated central pressure is 991 hPa. The associated maximum sustained wind speed is 30 kt gusting to 40 kt.

Raipur (42874, Chhattisgarh) reported mean sea level pressure (MSLP) as 991.9 hPa, pressure change in past 24 hrs (P24) as -3.4 hPa and maximum sustained wind speed (MSW) as 360⁰/02 kt. Bilaspur (42782, Chhattisgarh) reported MSLP as 993.4 hPa, P24 as -0.8 hPa and MSW as calm. Nagpur (42867, Maharashtra) reported MSLP as 993.7 hPa, P24 as -4.3 hPa and MSW as 290⁰/04 kt. Jagdalpur (43041, Chhattisgarh) reported MSLP as 993.6 hPa, P24 as -4.0 hPa and MSW as 180⁰/05 kt. Ramagundam (43086, Telangana) reported MSLP as 994.8 hPa, P24 as -4.5 hPa and MSW as calm.

As per INSAT 3DS imagery at 0000 UTC of 30th July, associated scattered to broken low & medium clouds with embedded intense to very intense convection over Madhya Pradesh, Vidarbha, Madhya Pradesh, South Chhattisgarh, South Odisha, Telangana, coastal Andhra Pradesh, westcentral Bay of Bengal (minimum Cloud Top Temperature is -70 to -90°C).

REMARKS:

The low level vorticity is the same in past 6 hours and is about $150 \times 10^{-6} \text{ s}^{-1}$ over Chhattisgarh. Vertically, it is extending upto 200 hPa level. The low level convergence has decreased in past 6 hours and is around $30 \times 10^{-6} \text{ s}^{-1}$ over the system area. Upper level divergence is the same in past 6 hours and is around $20 \times 10^{-6} \text{ s}^{-1}$ over system area. Vertical wind shear of horizontal wind is moderate 15-20 kt over the system area and is likely to become high as the system moves westwards towards Madhya Pradesh.

The guidance from NCICS model indicates westerly wind anomaly (3-5 mps) alongwith prevalence of Equatorial Rossby wave (ERW) over south peninsular India and easterly wind anomaly (>9 mps) alongwith passing Kelvin wave (KW) to its north. These features are providing favourable environment for maintenance of intensity of the system.

Guidance from numerical models:

Most of the models (ECMWF, GFS) are capturing the system as a deep depression. It is indicated to move west-northwestwards during next 24 hrs. However, ECMWF is indicating weakening into a depression by 30th/ 1200 UTC, while GFS group is now indicating weakening into a depression by 30th/0600 UTC and into a low pressure area by 30th/ 1200 UTC.

Based on the observations and guidance from various numerical models:

Confidence Level in estimation of current location and intensity: **High**

Confidence Level in prediction of forecast track: **High**

Confidence Level in prediction of forecast intensity: **Moderate**

Considering all the above, the deep depression over **central parts of Chhattisgarh is very likely** to move nearly westwards across Chhattisgarh, east Madhya Pradesh & adjoining Vidarbha and weaken gradually into a depression during next 12 hours
