TROPICAL CYCLONE ADVISORY NO. 32 FOR NORTH INDIAN OCEAN (THE BAY OF BENGAL AND ARABIAN SEA) VALID FOR NEXT 120 HOURS ISSUED AT 2330 UTC OF 29.11.2025 BASED ON 2100 UTC OF 29.11.2025

Cyclonic Storm Ditwah [Pronunciation: Ditwah] over southwest Bay of Bengal and adjoining Tamil Nadu-Puducherry coasts:

The **Cyclonic Storm Ditwah [Pronunciation: Ditwah]** over southwest Bay of Bengal and adjoining north Sri Lanka moved nearly northwards with the speed of 5 kmph during past 6 hours and lay centered at 2100 UTC of today, the 29th November 2025 over the same region, near latitude 10.8°N and longitude 80.6°E about 80 km east of Karaikal (43346), 100 km east-northeast of Vedaranniyam (43349), 140 km north-northeast of Jaffna (43404), 160 km south-southeast of Puducherry (43331) and 250 km south of Chennai (43279).

It is very likely to move nearly northwards parallel to North Tamil Nadu-Puducherry coasts during next 24 hours.

While moving northwards the cyclonic storm will be centered over southwest Bay of Bengal within a minimum distance of 50 km and 25km from the Tamil Nādu-Puducherry coastline by early morning and evening of tomorrow, the 30th November respectively.

Forecast track and intensity are given in Table below

Date/Time (UTC)	Position (Lat. °N/ Long. °E)	Maximum Sustained Surface Wind Speed (Kmph)	Category Of Cyclonic Disturbance
29.11.25/2100	10.8/80.6	70-80 gusting to 90	Cyclonic Storm
30.11.25/0000	11.1/80.5	70-80 gusting to 90	Cyclonic Storm
30.11.25/0600	11.6/80.5	65-75 gusting to 85	Cyclonic Storm
30.11.25/1200	12.2/80.5	55-65 gusting to 75	Deep Depression
30.11.25/1800	12.8/80.5	50-60 gusting to 70	Deep Depression
01.12.25/0600	13.8/80.5	45-55 gusting to 65	Depression

As per INSAT 3DR at 2100 UTC, Intensity T2.5, the associated scattered to broken low and medium clouds with embedded intense to very intense convection lay over southwest adjoining westcentral Bay of Bengal, Tamil Nadu, south Coastal Andhra Pradesh, Rayalaseema, South-interior Karnataka and Kerala (minimum CTT minus 70-90 degree Celsius). Moderate to intense convection lay over Comorin Area, Palk Strait, Gulf of Mannar, Sri Lanka and rest of southwest Bay of Bengal (minimum CTT minus 40-60 degree Celsius).

The estimated central pressure is about 1001 hPa. The associated maximum sustained wind speed is about 40 knots gusting upto 50 knots.

Sea condition is high over southwest Bay of Bengal & adjoining north Sri Lanka, Gulf of Mannar, Comorin area and along & off Tamil Nadu-Puducherry coasts.

Strom surge warning: Storm surge of height about 0.3 m to 0.5m above the astronomical tide (0.4 m during high tide) is likely to inundate the low-lying coastal areas of Tamil Nadu- Puducherry till 30th/ 0000 UTC.

REMARKS:

The guidance from various models indicates that the Madden Julian Oscillation (MJO) index is presently in phase 7 with amplitude more than 1 and is likely to continue in same phase during next 5 days. The sea surface temperature is around 28°C over southwest Bay of Bengal and along & off Sri Lanka, Tamil Nadu & South Andhra Pradesh coast along the forecast track.

The guidance from NCICS model indicates westerly wind anomaly (7-9 mps) along with prevalence of Equatorial Rossby Wave (ERW), Kelvin wave (KW) and low frequency background wave (LW) over the southern parts of the Bay of Bengal (BoB) and adjoining southeast Arabian Sea (AS) and easterly wind anomaly (3-5 mps) to its north over southwest BoB off Tamil Nadu coast-Andhra Pradesh coasts on 29th & 30th November. Thereafter, slight weakening of these features is indicated.

The Low level relative vorticity at 850 hPa is about $100 \times 10^{-6} \text{ s}^{-1}$ over Sri Lanka and adjoining southwest Bay of Bengal to the south of system centre. Vertically the positive vorticity zone is extending up to 200hPa and tilting slightly southwestwards with height. Upper-level divergence is around $10 \times 10^{-6} \text{ s}^{-1}$ around the system. Low-level convergence is around $20 \times 10^{-6} \text{ s}^{-1}$ around the system centre. Mid layer shear is around (10-15 kts) and anti-cyclonic over the system area. The deep layer wind shear of horizontal wind is moderate (15-20 kt) and anti-cyclonic over the system area and hence favorable to

maintain intensity. Warm air advection is continuously taking place from south and southeast sector towards the core of the system.

However, as it moves northwards, it may encounter higher wind shear over southwest BoB and along & off North Tamil Nadu coast. As the system has emerged into sea, the intensity of the system has increased. However cold and dry air from the southern peninsular is touching the northwest sector. As a result with the northwards movement of the system there could be more incursion of dry and cold air.

However, favorable outflow, warm moist air incursion, support from equatorial waves and favorable thermodynamic features will support system to maintain its intensity till 30th November/ 0300 UTC. Thereafter, weakening is likely due to high wind shear, low ocean thermal energy, and cold dry air incursion from northwest sector.

There is good consensus among various models with respect to northwards movement of the system across southwest Bay of Bengal off Tamil Nadu, Puducherry and adjoining south Andhra Pradesh coasts till 1st December. There is also consensus among various models wrt weakening of the system from 30th/ 1200 UTC onwards.

- (i) Confidence level in estimation of current location of Cyclonic Storm: High
- (ii) Confidence level in estimation of estimation of current intensity: High
- (iii) Confidence level in forecast track: High
- (iv) Confidence level in forecast intensity: Moderate
